title	content	class	img	type
Description of my work	My job here was to convert this simple site into OO site. So I created dB on my localhost server with table "articles", and added several articles in dB. Every article contains title, content, class and image field. I used "render" method to fill the fields of articles. At the end I used "foreach" loop to show the data.	main	images/www2.jpg	main
